Phishing Activity Trends Report April, 2006

Phishing is a form of online identity theft that employs both social engineering and technical subterfuge to steal consumers' personal identity data and financial account credentials. Social-engineering schemes use 'spoofed' e-mails to lead consumers to counterfeit websites designed to trick recipients into divulging financial data such as account usernames and passwords. Hijacking brand names of banks, e-retailers and credit card companies, phishers often convince recipients to respond. Technical subterfuge schemes plant crimeware onto PCs to steal credentials directly, often using key logging systems to intercept consumers online account user names and passwords, and to corrupt local and remote navigational infrastructures to misdirect consumers to counterfeit websites and to authentic websites through phisher-controlled proxies that can be used to monitor and intercept consumers' keystrokes.

The monthly Phishing Activity Trends Report analyzes phishing attacks reported to the Anti-Phishing Working Group (APWG) via the organization's website at http://www.antiphishing.org or email submission to reportphishing@antiphishing.org. The APWG phishing attack repository is the Internet's most comprehensive archive of email fraud and phishing activity. The APWG additionally measures the evolution, proliferation and propagation of crimeware drawing from the independent research of our member companies. In the second half of this report are tabulations of crimeware statistics and reportage on specific criminal software detected by our member researchers.

Highlights

- Number of unique phishing reports received in April: 17,490
- Number of unique phishing sites received in April: 11,121
- Number of brands hijacked by phishing campaigns in April: 92
- Number of brands comprising the top 80% of phishing campaigns in April: 5
- Country hosting the most phishing websites in April: United States
- Contain some form of target name in URL: 33 %
- No hostname just IP address: 37 %
- Percentage of sites not using port 80: 5.6 %
- Average time online for site: 5.0 days
- Longest time online for site: 31 days

Methodology

APWG is continuing to refine and develop our tracking and reporting methodology. We have recently re-instated the tracking and reporting of unique phishing reports (email campaigns) in addition to unique phishing sites. An email campaign is a unique email sent out to multiple users, directing them to a specific phishing web site, (multiple campaigns may point to the same web site). APWG counts unique phishing report emails as those in a given month with the same subject line in the email.

APWG also tracks the number of unique phishing websites. This is now determined by unique base URLs of the phishing sites.

APWG is also tracking crimeware instances (unique software applications as determined by MD5 hash of the crimeware sample) as well as unique sties that are distributing crimeware (typically via browser drive-by exploits).

The Phishing Attack Trends Report is published monthly by the Anti-Phishing Working Group, an industry association focused on eliminating the identity theft and fraud that result from the growing problem of phishing and email spoofing. For further information, please contact Ronnie Manning at rmanning@websense.com or 858.320.9274 or APWG Secretary General Peter Cassidy at 617.669.1123. Analysis for the Phishing Attack Trends Report has been donated by the following companies:
Phishing Email Reports And Phishing Site Trends

The total number of unique phishing reports submitted to APWG in April 2006 was 17,490 – a drop of almost a thousand attacks from March. This is a count of unique phishing email reports.

The number of unique phishing websites detected by APWG was 11,121 in April 2006, a monumental increase in unique phishing sites from March and the highest ever recorded by the APWG.
**Top Used Ports Hosting Phishing Data Collection Servers**

April saw a continuation of a trend of HTTP port 80 being the most popular port used at 94.3% of all phishing sites reported.

**Brands and Legitimate Entities Hijacked By Email Phishing Attacks**

**Number of Reported Brands**

April 2006 showed an increase of brands hijacked than March 2006.
Most Targeted Industry Sectors

Financial Services continue to be the most targeted industry sector, growing to 89% of all attacks in the month of April.

Web Phishing Attack Trends

Countries Hosting Phishing Sites

In April, Websense® Security Labs™ saw a continuation of the top three countries hosting phishing websites. The United States remains the on the top of the list with 26.3%. The rest of the top 10 breakdown is as follows – note that this is the closest China has ever been to the United States: China 21.2%, Republic of Korea 7.2%, Japan 2.9%, Germany 2.8%, France 2.2%, Canada 1.9%, India 1.7%, Netherlands 1.5%, Italy 1.4%
PROJECT: Crimeware

Crimeware Taxonomy & Samples According to Classification in April

PROJECT: Crimeware categorizes crimeware attacks as follows, though the taxonomy will grow as variations in attack code are spawned:

**Phishing-based Trojans - Keyloggers**

**Definition:** Crimeware code which is designed with the intent of collecting information on the end-user in order to steal those users’ credentials. Unlike most generic keyloggers, phishing-based keyloggers have tracking components which attempt to monitor specific actions (and specific organizations, most importantly financial institutions and online retailers and ecommerce merchants) in order to target specific information, the most common are; access to financial based websites, ecommerce sites, and web-based mail sites.

---

**Phishing-based Trojans – Keyloggers, Unique Variants**

![Graph showing password stealing malicious code unique applications]

**Phishing-based Trojans – Keyloggers, Unique Websites Hosting Keyloggers**

![Graph showing password stealing malicious code URLs]
**Phishing-based Trojans – Redirectors**

**Definition:** Crimeware code which is designed with the intent of redirecting end-users network traffic to a location where it was not intended to go to. This includes crimeware that changes hosts files and other DNS specific information, crimeware browser-helper objects that redirect users to fraudulent sites, and crimeware that may install a network level driver or filter to redirect users to fraudulent locations. All of these must be installed with the intention of compromising information which could lead to identify theft or other credentials being taken with criminal intent.

Along with phishing-based keyloggers we are seeing high increases in traffic redirectors. In particular the highest volume is in malicious code which simply modifies your DNS server settings or your hosts file to redirect either some specific DNS lookups or all DNS lookups to a fraudulent DNS server. The fraudulent server replies with “good” answers for most domains, however when they want to direct you to a fraudulent one, they simply modify their name server responses. This is particularly effective because the attackers can redirect any of the users requests at any time and the end-users have very little indication that this is happening as they could be typing in the address on their own and not following an email or Instant Messaging lure.

**Phishing-based Trojans & Downloader’s Hosting Countries (by IP address)**

The chart below represents a breakdown of the websites which were classified during April as hosting malicious code in the form of either a phishing-based keylogger or a Trojan downloader which downloads a keylogger.

The United States is still the top geographic location with 57.19%

The rest of the breakdown was as follows; Spain 7.87%, China 5.7%, Brazil 3.19%, Russia 2.63%, Germany 2.41%, United Kingdom 1.99%, Republic of Korea 1.97%, Argentina 1.9%, Canada 1.43%
Phishing Research Contributors

MarkMonitor
MarkMonitor is the global leader in delivering comprehensive online corporate identity protection services, with a focus on making the Internet safe for online transactions.

PandaLabs
PandaLabs is an international network of research and technical support centers devoted to protecting users against malware.

Websense Security Labs™
Websense Security Labs mission is to discover, investigate, and report on advanced Internet threats to protect employee computing environments.

About the Anti-Phishing Working Group

The Anti-Phishing Working Group (APWG) is an industry association focused on eliminating the identity theft and fraud that result from the growing problem of phishing and email spoofing. The organization provides a forum to discuss phishing issues, define the scope of the phishing problem in terms of hard and soft costs, and share information and best practices for eliminating the problem. Where appropriate, the APWG will also look to share this information with law enforcement.

Membership is open to qualified financial institutions, online retailers, ISPs, the law enforcement community, and solutions providers. There are more than 1500 companies and government agencies participating in the APWG and more than 2300 members. Note that because phishing attacks and email fraud are sensitive subjects for many organizations that do business online, the APWG has a policy of maintaining the confidentiality of member organizations.

The website of the Anti-Phishing Working Group is http://www.antiphishing.org. It serves as a public and industry resource for information about the problem of phishing and email fraud, including identification and promotion of pragmatic technical solutions that can provide immediate protection and benefits against phishing attacks. The analysis, forensics, and archival of phishing attacks to the website are currently powered by Tumbleweed Communications’ Message Protection Lab.

The APWG was founded by Tumbleweed Communications and a number of member banks, financial services institutions, and e-commerce providers. It held its first meeting in November 2003 in San Francisco and in June 2004 was incorporated as an independent corporation controlled by its steering committee, its board and its executives.
